

APPLICATION BULLETIN

Customer: Interface Flooring Systems

Application: Repack operation and storage of yarn, carpet remnants, wood, shrink-wrap and cardboard

Product: ROPAK™ 40"x48"x39" containers

Problem: Corrugated boxes with plastic bases and lids were used to collect and handle waste material. The snaps that held the plastic pieces on the top and bottom of the boxes tore out, creating safety issues. The boxes were about 50" high and made it difficult for employees to load, unload and move around the plant without being easily damaged.

Solution: The company initially purchased about 1,000 containers. These containers have two solid sidewalls and two drop doors for easy access to the contents inside. The containers also have a built-in pallet with four-way entry, so they can be moved easily by a lift truck without the risk of damaging the product or the container.

Results: The payback period was less than six months on the original purchase. The containers not only improved the material handling operation and the plant appearance, but also reduced product damage and safety issues.
